Tree Definitions

A **tree** อาจ

- empty ไม่มี **nodes** เรียก **null tree / empty tree**
หรือ
- ประกอบด้วย
 - root node**
 - ≥ 0 subtrees**

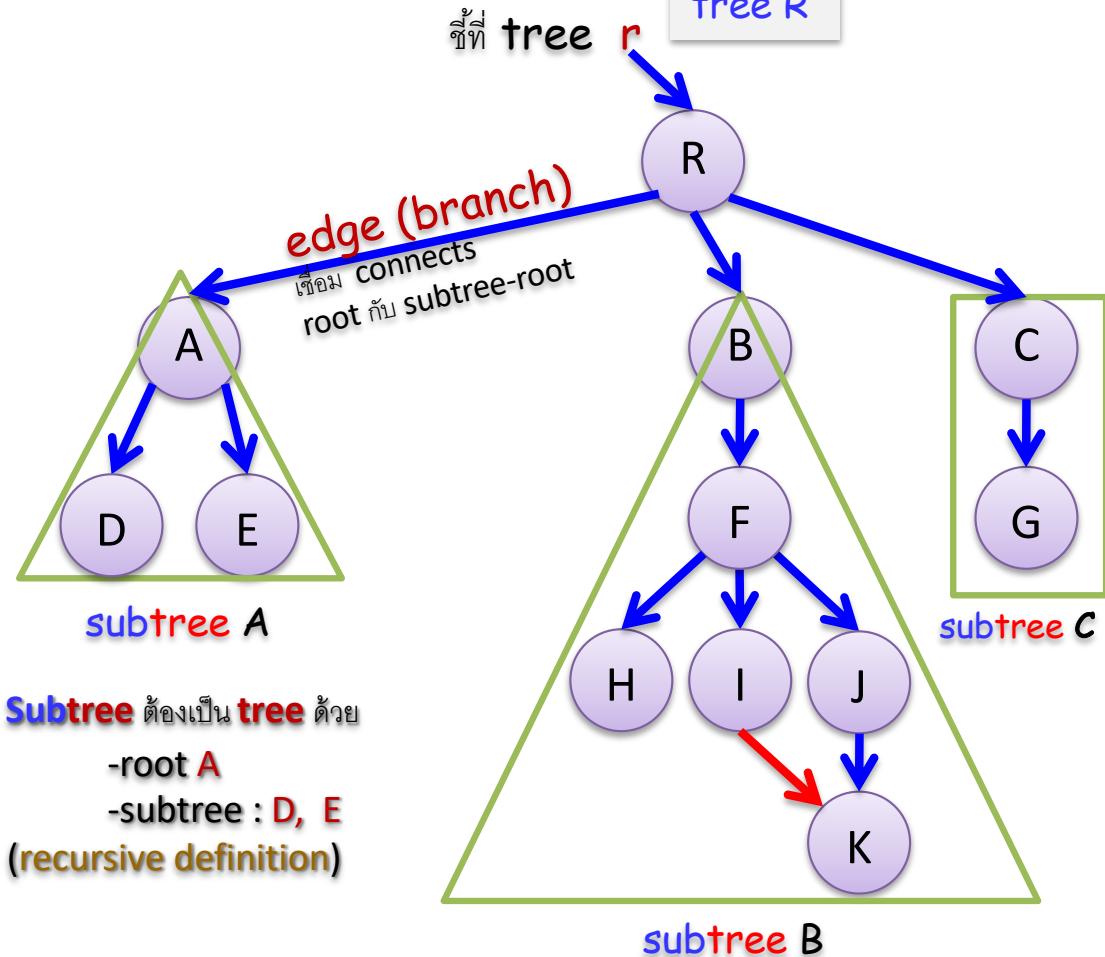

Node ใน tree ต้อง **disjoint** กัน

ต้องไม่มี node ร่วมกันใน root หรือ ใน subtrees

ชื่อของ tree นิยมเรียกตาม **root**

tree R

K ไม่ disjoint (อยู่ในทั้ง subtree I & subtree J) → R ไม่ใช่ tree
ใน **tree : branches** ไม่เชื่อมเป็นวง

Tree Definitions

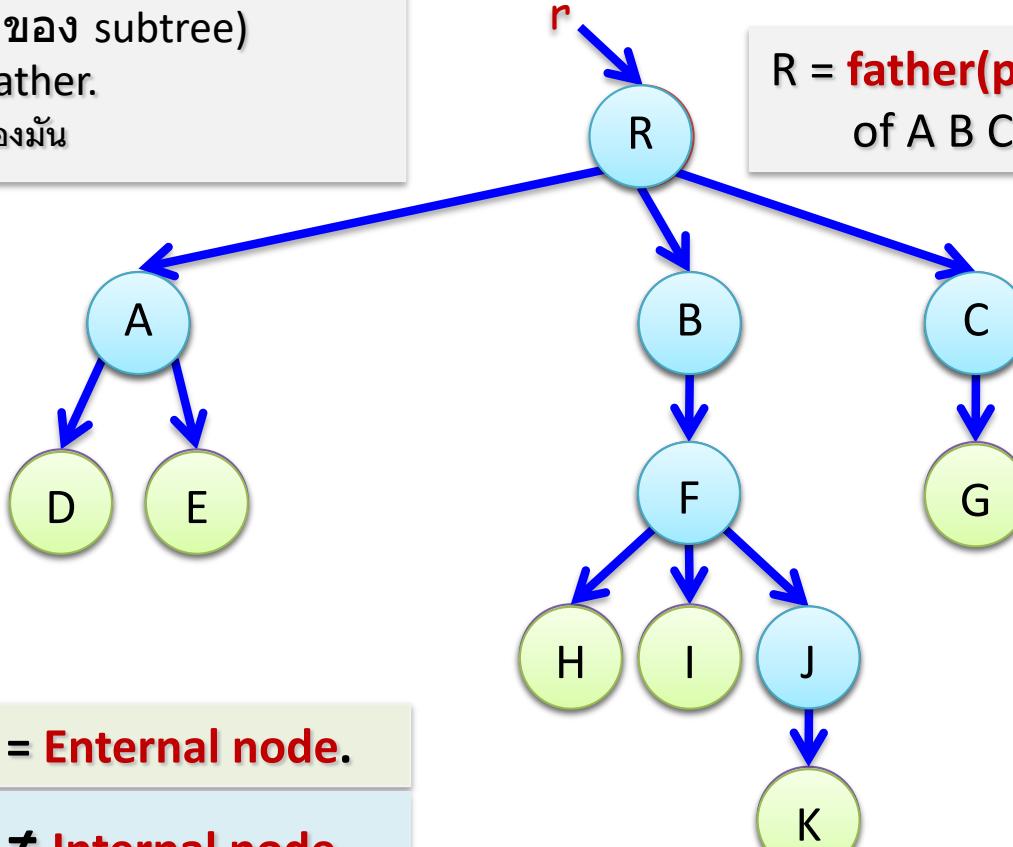

Root = **father (parent)** of subtree's root.
= **father** ของ root ของ subtree

Subtree's root (root ของ subtree)
= **son (child)** of his father.
= **son (child)** ของพ่อของมัน

Root ไม่มีพ่อ

R = **father(parent)**
of A B C

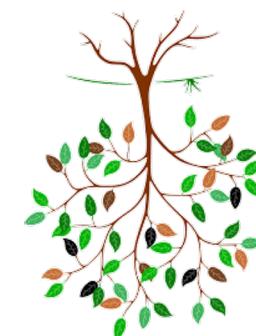

A B C = **sons(childs)**
of R

Leaf (leave) = External node.

Leaf (leave) ≠ Internal node.

Leaf (leave)
= node with no son.
= node ที่ไม่มีลูก

Father of F ?
Sons of A ?
Father of R ?
Sons of H ?

Siblings	Leaf Grand Parent	Internal Grand Child
----------	----------------------	-------------------------

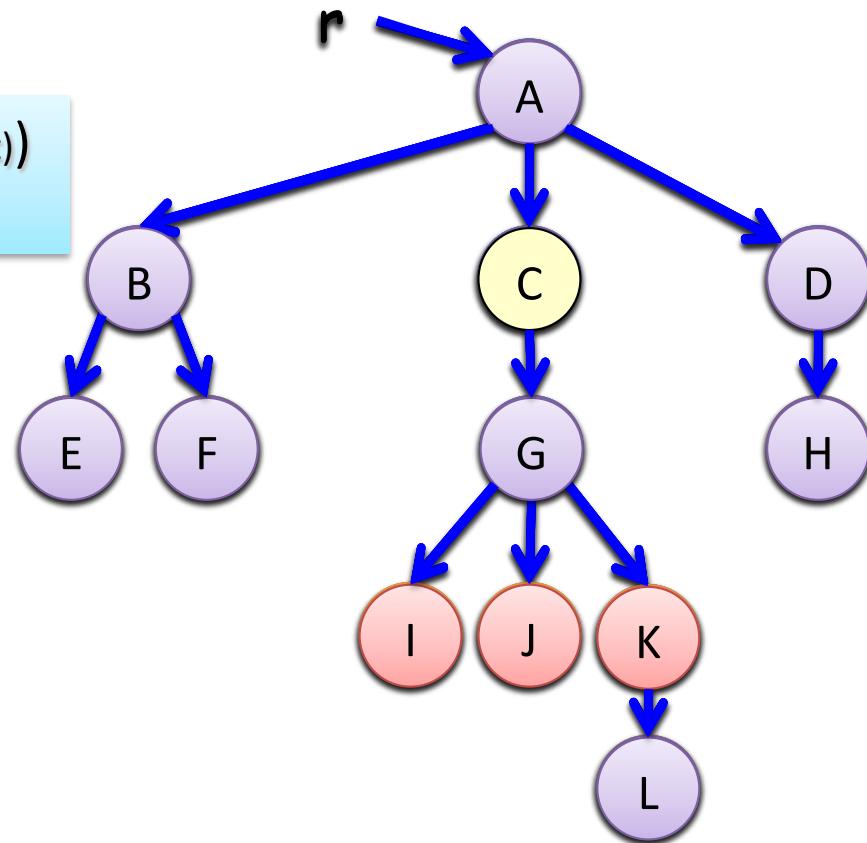

Leaf node (external, outer, terminal)
node with no son

Branch node (internal, inner, inode (for short))
node ≠ leaf

Siblings (brothers)
node with same father

Grand Parent
father of father

Grand Child
son of son

Path, Path Length, Depth, Height

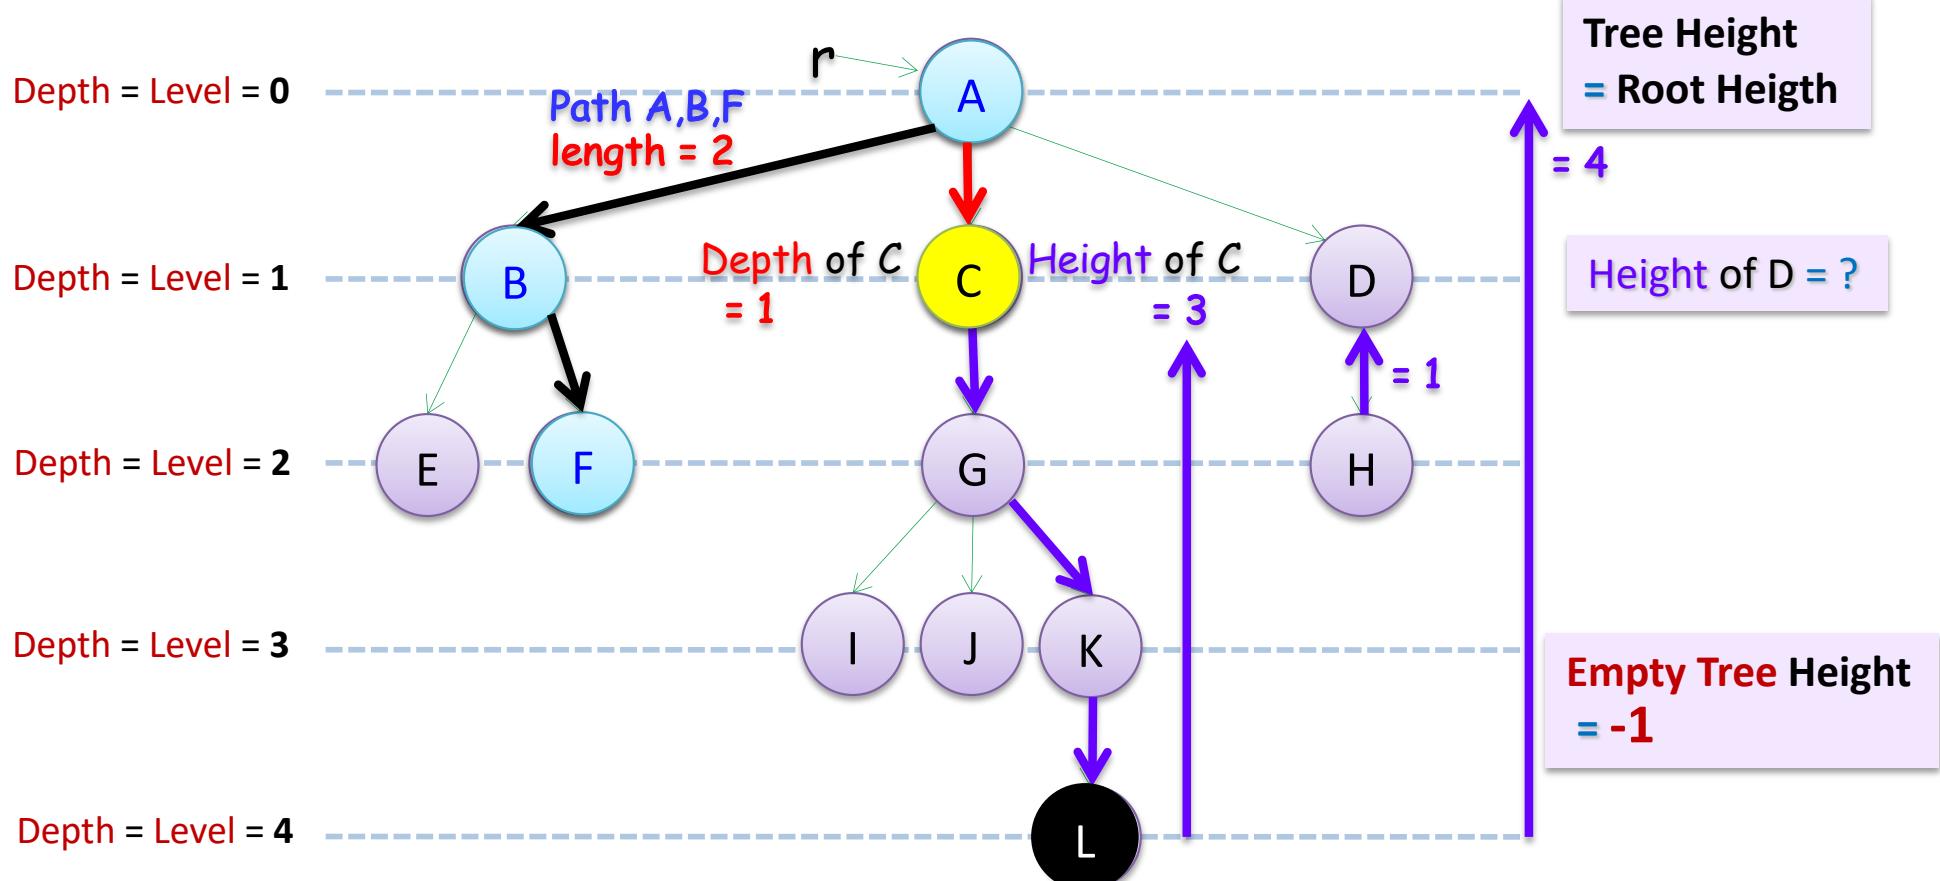

Path (from n to d) sequence of nodes and edges connecting a node n with a descendant d

In tree, only 1 path from node to node

Depth (level) of node = path length from root to node

Height of node = longest path length from node to leaf

Path length = # edge in path

Ancestor & Descendent

Ancestor បរាបុគ្គលិក

father of ancestor

A = ancestor of D

if has path from A to D

Decendent ត្វាងលាន

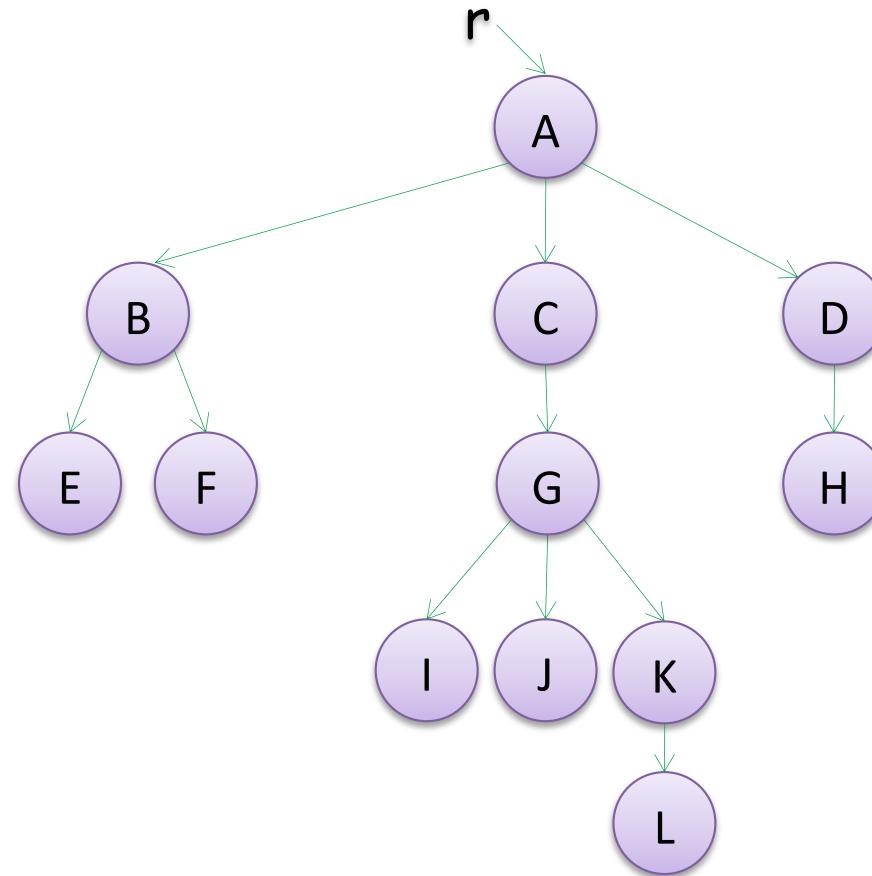

son of decendent

A = Proper Ancestor of D

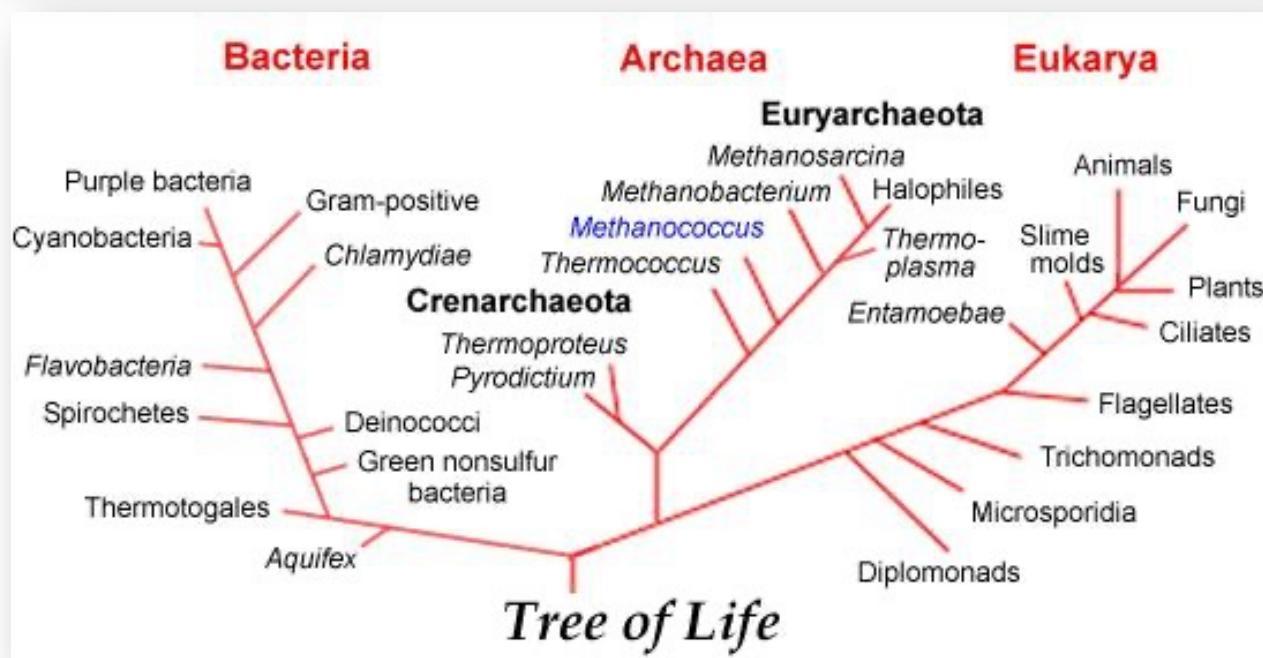

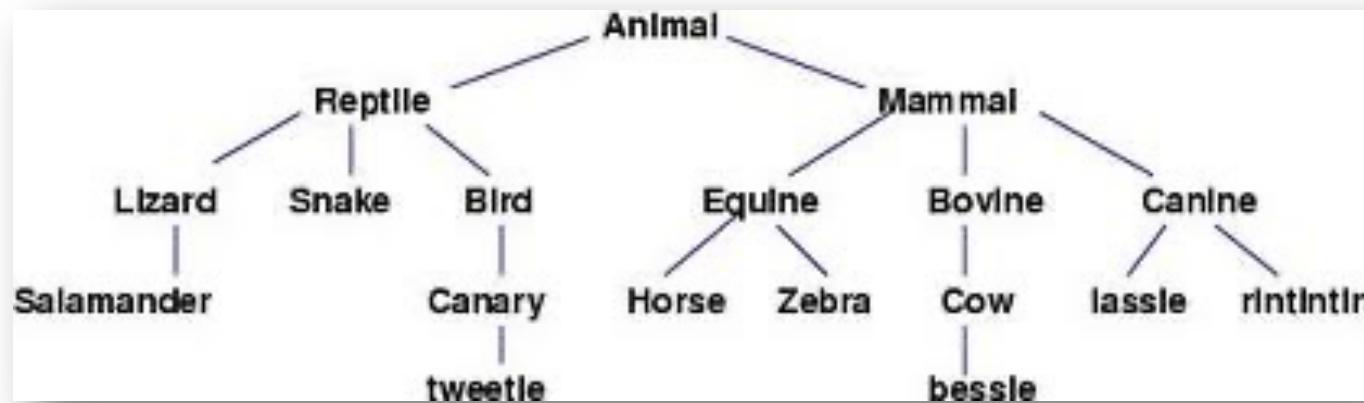

if $A \neq D$

D = Proper Decendent of A

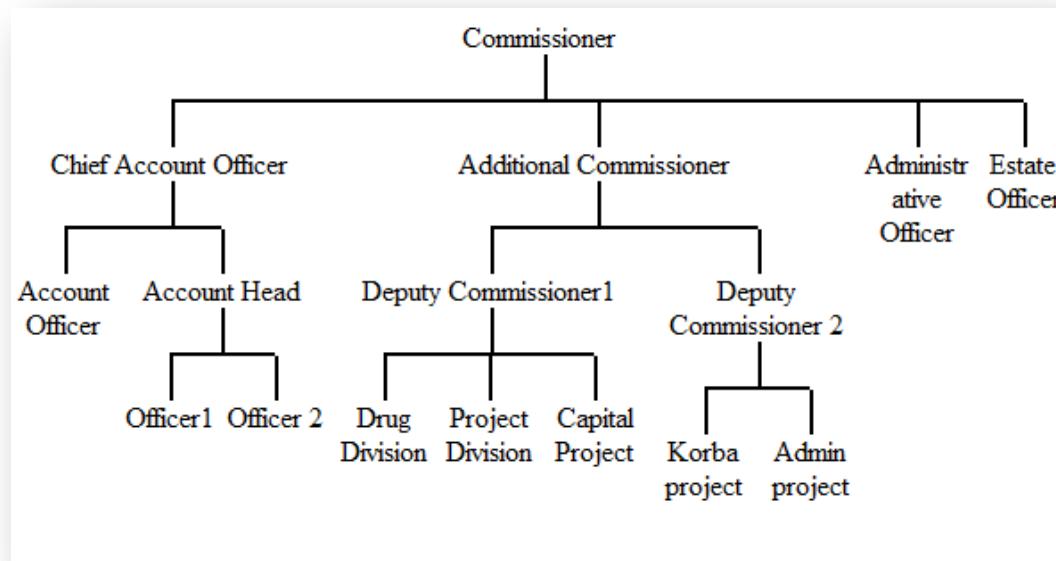

if $D \neq A$

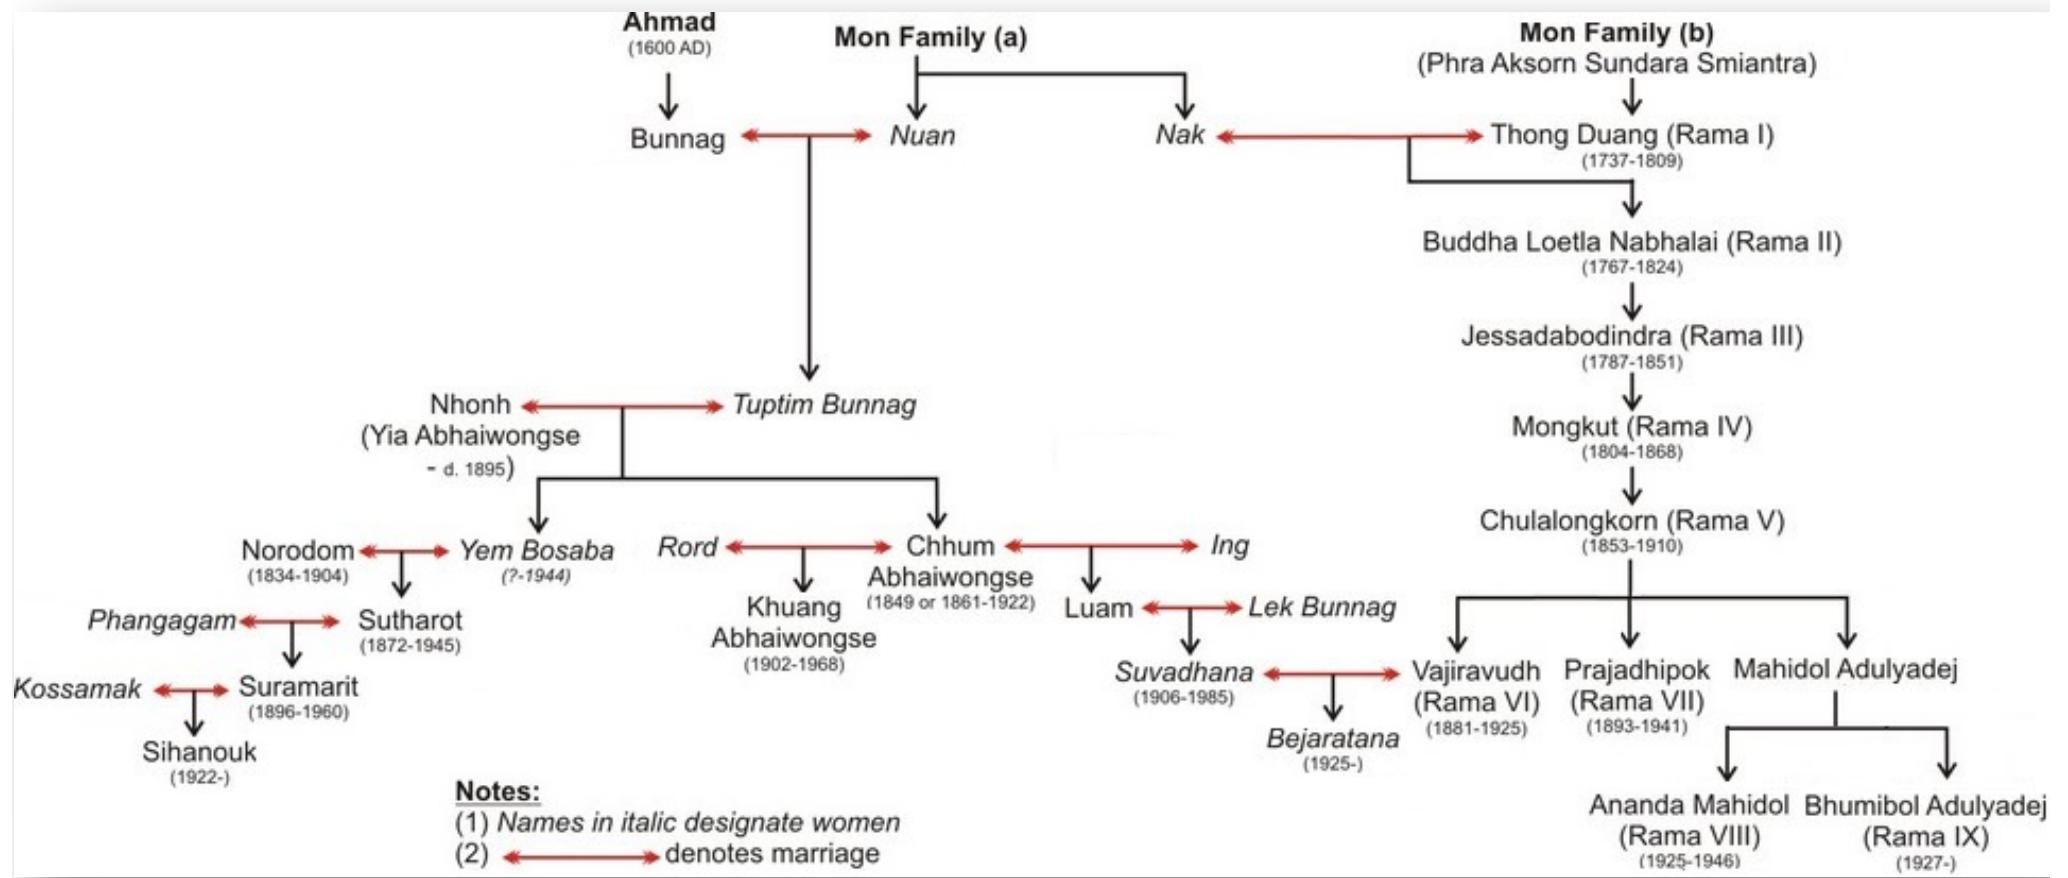

Tree Examples

4. Which Representations ?
5. n-ary Tree
6. Generic Tree
7. Multiway Search Tree
8. B-Trees

Binary Tree

bi = 2

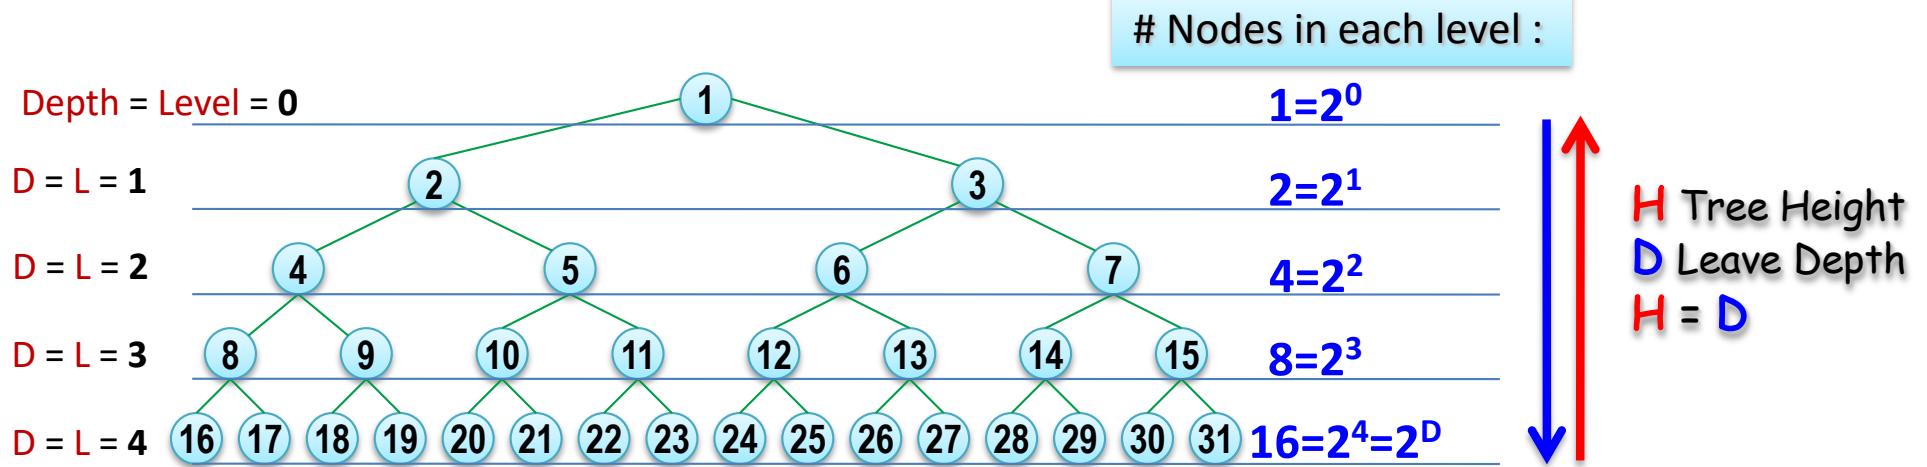

Binary Tree : มีอย่างมากที่สุด 2 subtrees (0, 1 or 2 subtrees)

Normally not draw
• branch direction
• null ptr

Perfect Binary Tree

Perfect Binary Tree (Ambiguously also called Complete Binary Tree) Every level is completely filled

N = จำนวน node ใน perfect binary tree

$$N = 2^0 + 2^1 + \dots + 2^H \quad \sum_{i=0}^N r^i = \frac{1 - r^{n+1}}{1 - r}, r <> 1$$
$$N = 2^{H+1} - 1$$

$$H = D = \log_2(N+1) - 1$$

$$O(\log_2(N))$$

$$N = (2^H \text{ external}) + (2^H - 1 \text{ internal})$$

Perfect Binary Tree of N nodes height H :

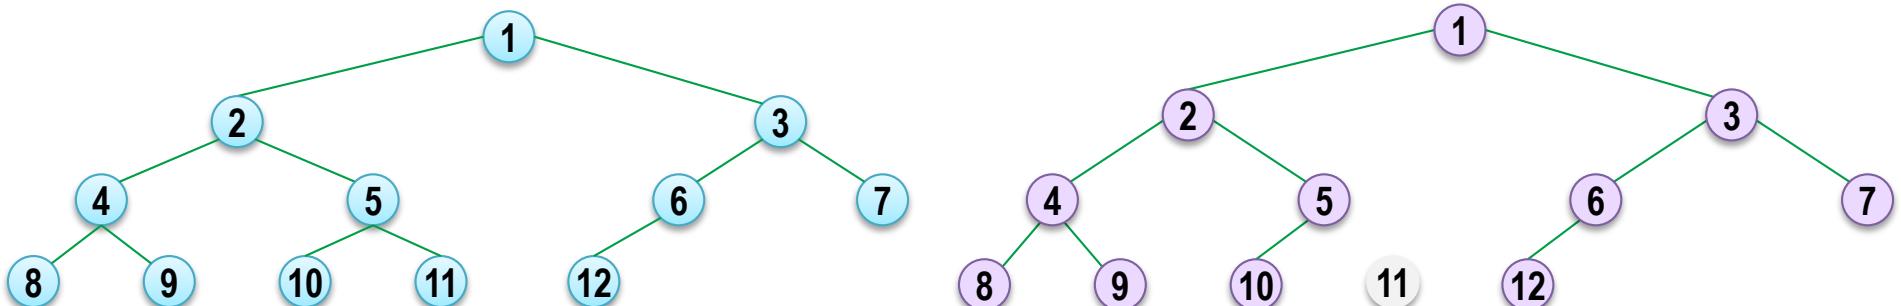

$$H = \log_2(N+1) - 1$$

$$N = 2^{H+1} - 1$$

Complete Binary Tree

Complete Binary Tree

Every level, except possibly the last, is completely filled &
All nodes are as far left as possible.

Complete binary tree

Without node 11 :
Not a complete binary tree

Perfect Binary Tree & Complete Binary Tree

N จำนวน node และ H ความสูง

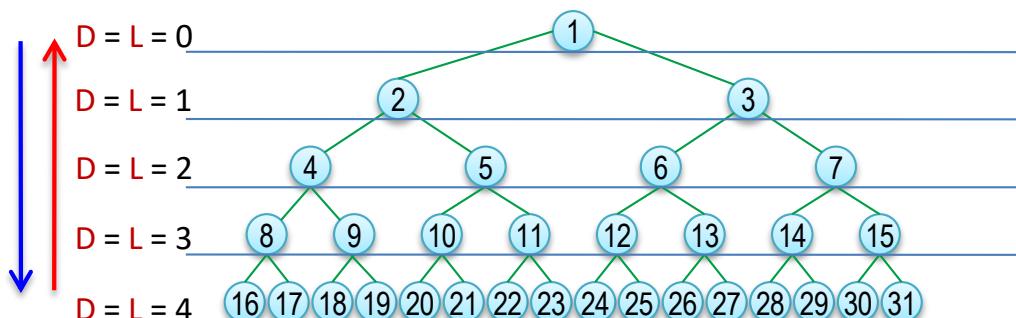

Perfect Binary Tree

$$H = \log_2(N+1) - 1$$

$$= \lfloor \log_2 N \rfloor$$

$$N = 2^{H+1} - 1$$

$$\rightarrow O(\log_2(N))$$

H Tree Height

D Leaf Depth

$$H = D$$

Perfect Binary Tree

Every level is completely filled

(Ambiguously also called Complete Binary Tree)

Complete Binary Tree

$$H = \log_2(N+1) - 1$$

$$= \lfloor \log_2 N \rfloor$$

$$\rightarrow O(\log_2(N))$$

N ระหว่าง $[2^H, 2^{H+1} - 1]$

Nodes
in each level

$$1=2^0$$

$$2=2^1$$

$$4=2^2$$

$$8=2^3$$

$$16=2^4=2^D$$

$$2^H=2^3=8$$

$$⑯ 2^{H+1}=2^4=16$$

$$2^{H+1}-1$$

$$= 2^4$$

$$= 15$$

N total # of nodes

$$= 2^0 + 2^1 + \dots + 2^H$$

$$= 2^{H+1} - 1$$

เป็น external 2^H

internal $2^H - 1$

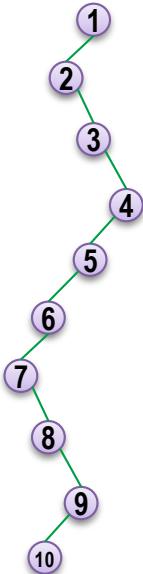

Complete Binary Tree

Every level is completely filled,
except possibly the last, &
All nodes are as far left as possible

Complete Binary Tree : H and N

How can 10 nodes in a binary tree has

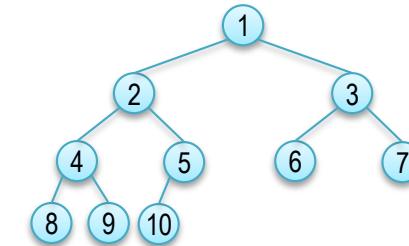

- longest search path ?
- shortest search path ?

Worst Case Height

Like Linked list : $H = N - 1$

$O(N)$

Best Case Height

Complete Binary Tree of N nodes height H :

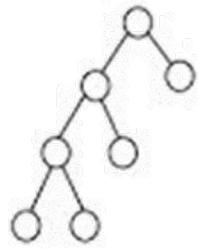

$$H = D = \lceil \log_2 (N+1) - 1 \rceil = \lfloor \log_2 N \rfloor$$

$O(\log N)$

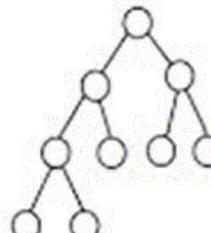

How much different N vs $\log_2 N$? $\log_2 1,000,000 < 20$

So
Complete Binary Tree
is an ideal tree

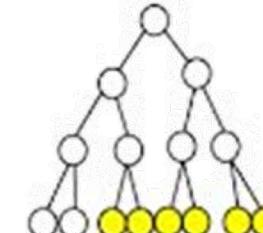

Full Complete Perfect

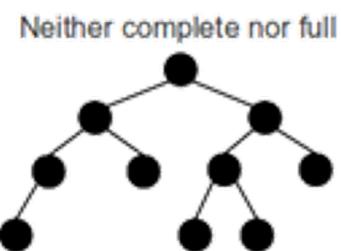

full

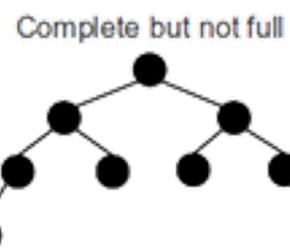

complete

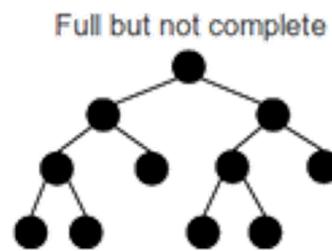

perfect

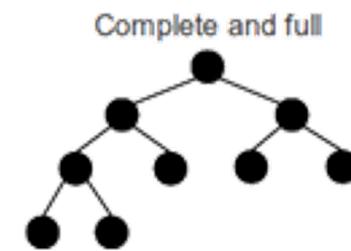

Neither complete nor full

Complete but not full

Full but not complete

Complete and full

Full Binary Tree: A Binary Tree is full if every node has 0 or 2 children. Following are examples of a full binary tree.

Complete Binary Tree: A Binary Tree is complete Binary Tree if all levels are completely filled except possibly the last level and the last level has all keys as left as possible.

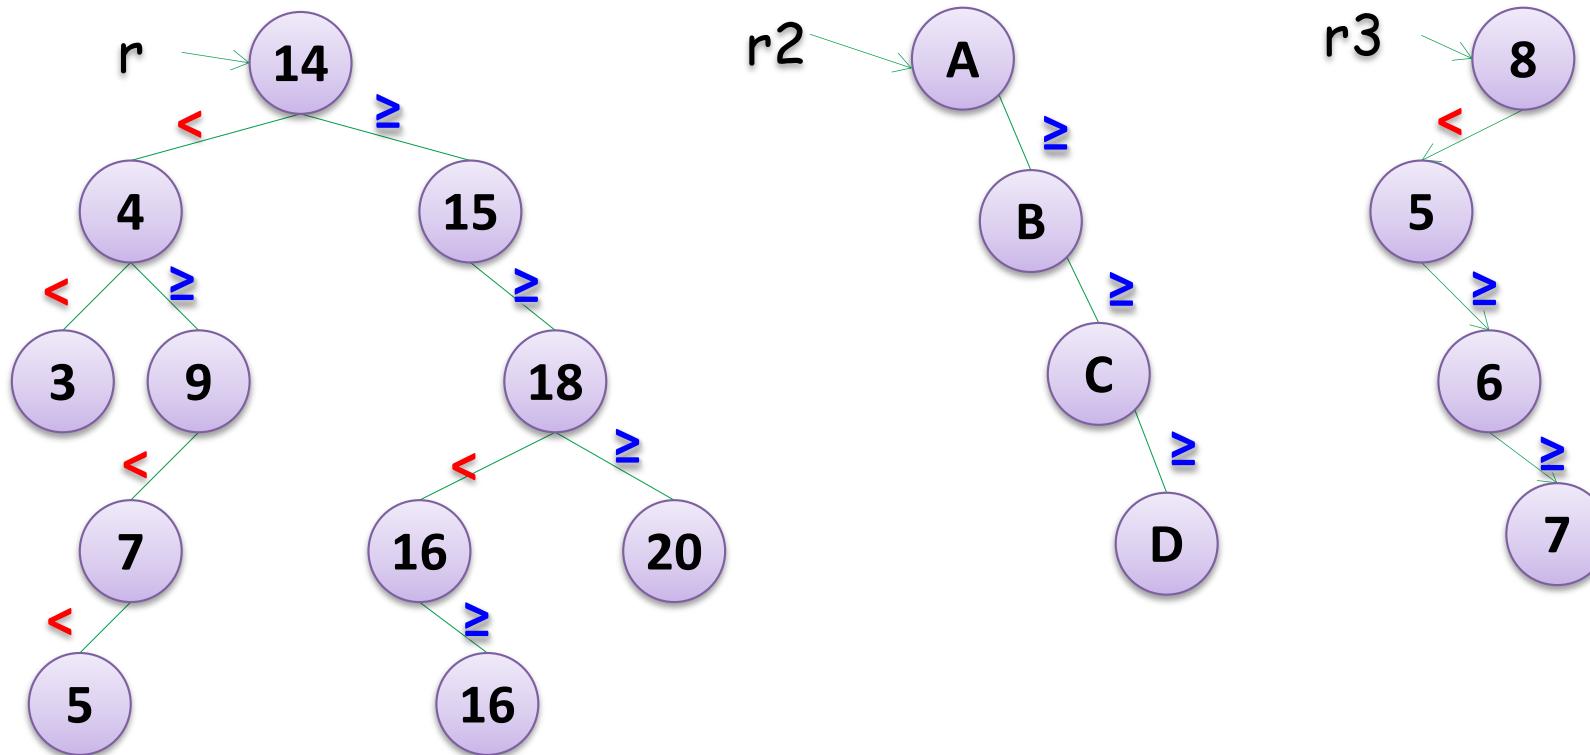

Perfect Binary Tree: A Binary tree is Perfect Binary Tree in which all internal nodes have two children and all leaves are at same level.

Binary Search Tree

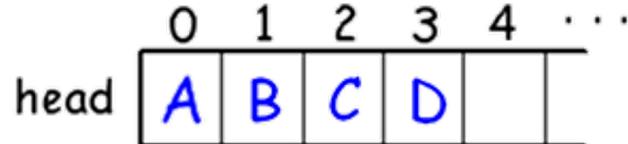

Binary Search Tree : for every node A

left descendants $< A$

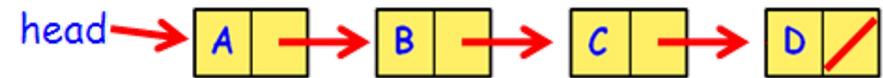

right descendants $\geq A$

Why Tree ?

Implicit (Sequential) Array
Insertion – Deletion Problems

Linear Linked list
Linear Search

$O(n)$

Tree
Tree Search

$O(\log_2 n)$

Binary Tree Traversals

Tree Traversal

การไปเยี่ยม (visit เช่นการพิมพ์ การ update ข้อมูล) ทุก node node ละ 1 ครั้ง อย่างมีระบบ
แบ่งตามลำดับของการ visit

Breadth First (Level Order) จาก root ไปด้านข้างก่อน

1. ลูกคนแรก ลูกคนที่ 2 ลูกคนที่ 3 ...จนหมดลูกทุกคน
2. ทำข้อ 1. กับทุกคนที่ไปเยี่ยมมาตามลำดับ

Depth-First Order จาก root ไปด้านลึกก่อนไปด้านข้าง

ลูกคนแรก และไปหานคนแรกก่อนไปที่ลูกคนที่ 2

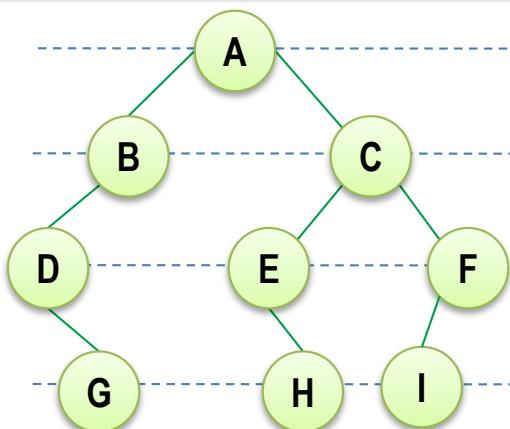

Breadth - First (Level Order)

Breadth First จาก root ไปด้านข้างก่อน ใช้ queue ช่วยในการหา

- ลูกคนแรก ลูกคนที่ 2 ลูกคนที่ 3 ...จนหมดลูกทุกคน
- ทำข้อ 1. กับทุกคนที่ไปเยี่ยมมาตามลำดับ

A B C D E F G H I

ไล่ไปทีละ level จึงเรียกอีกอย่างหนึ่งว่า Level Order

queue

deQ & visit

```
enQ ( root )
while ( notEmptyQ ) {
    n = deQ ( )
    visit(n)
    if ( n->left )
        enQ ( n->left )
    if ( n->right )
        enQ ( n-> right )
}
```

Depth - First Order

Depth-First Order จาก root ไปด้านลึกก่อน ไปด้านข้าง ใช้ stack ช่วยในการหาไปลูกคนแรก และไปหานคนแรกก่อนไปที่ลูกคนที่ 2
แบ่งเป็น 3 แบบ ขึ้นกับการวางแผนการ visit root ไว้ที่ใด

Inorder (Symmetric Order)

1. inOrder(leftSubtree)
2. **visit_root**
3. inOrder(rightSubtree)

Preorder

1. **visit_root**
2. preOrder(leftSubtree)
3. preOrder(rightSubtree)

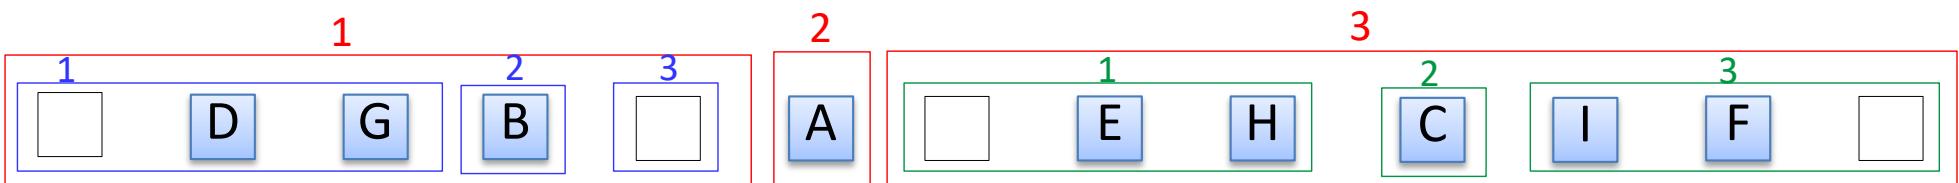

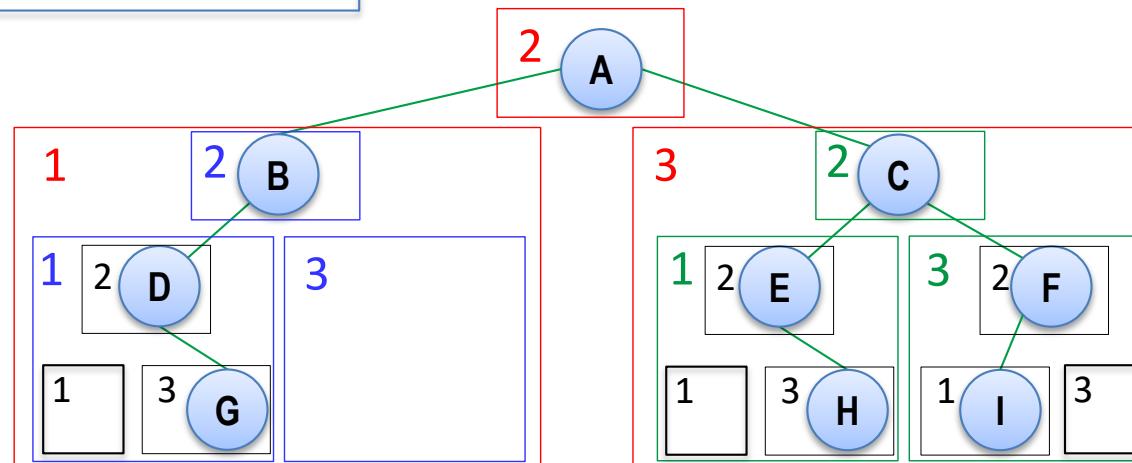

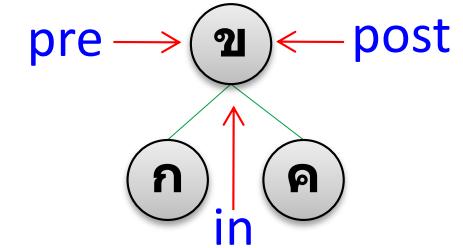

Postorder

1. postOrder(leftSubtree)
2. postOrder(rightSubtree)
3. **visit_root**

Inorder (Symmetric Order)

Algorithm:

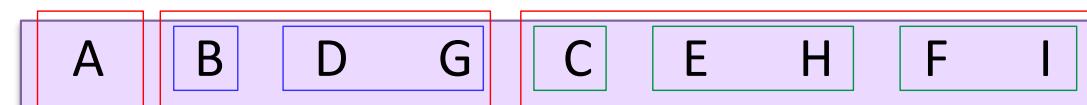

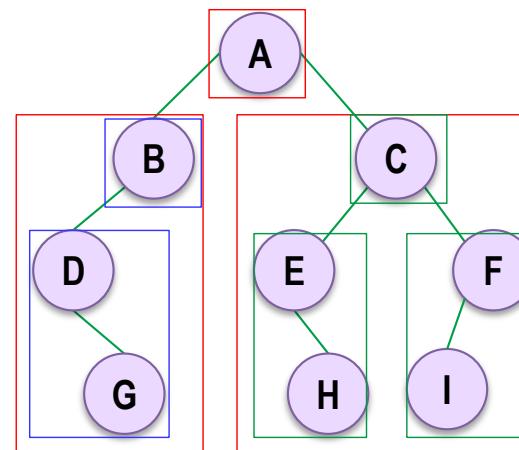

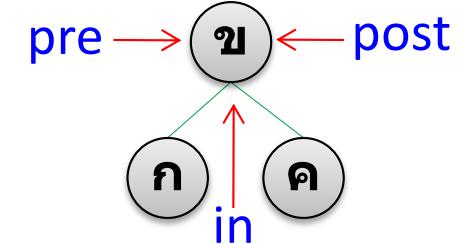

```
inOrder( root ) {  
    if (root != null){  
        inOrder(left subtree)  
        visit(root)  
        inOrder(right subtree)  
    }  
}
```

Preorder

Algorithm:

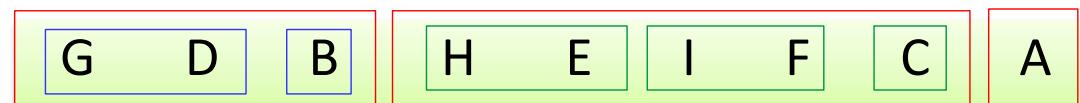

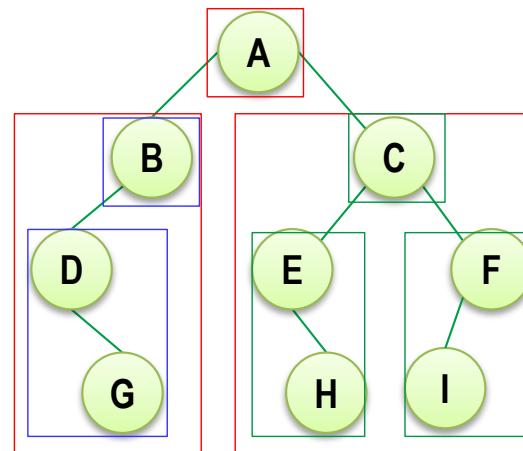

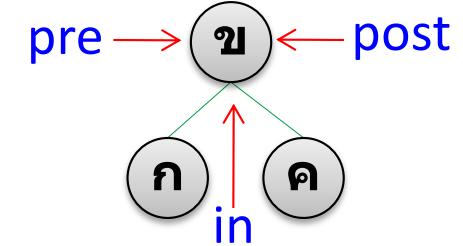

```
preOrder( root ) {  
    if (root != null){  
        visit(root)  
        preOrder(left subtree)  
        preOrder(right subtree)  
    }  
}
```

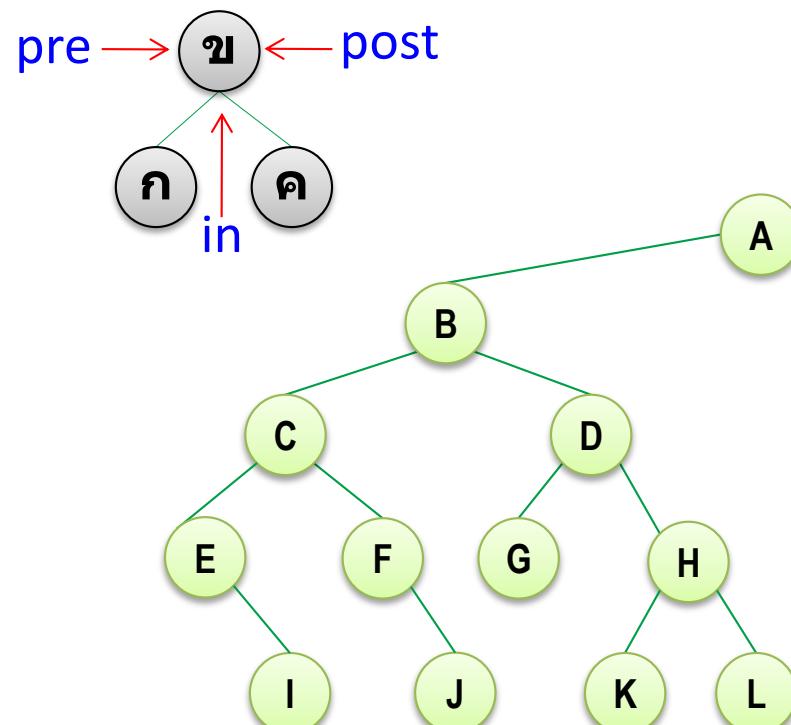

Postorder

Algorithm:

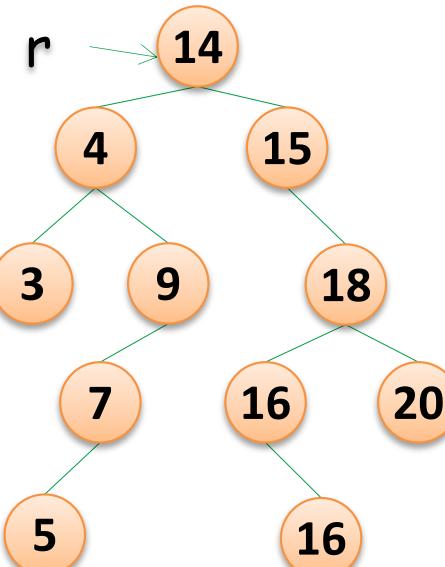

```
postOrder( root ) {  
    if (root != null){  
        postOrder(left subtree)  
        postOrder(right subtree)  
        visit(root)  
    }  
}
```

Test Your Self

Binary Search Tree

Inorder : $\text{L} \text{root} \text{R}$

1. inOrder(L)
2. visit_root
3. inOrder(R)

Postorder : $\text{L} \text{R} \text{root}$

Preorder : $\text{root} \text{L} \text{R}$

Inorder

E I C F J B G D K H L A

3 4 5 7 9 14 15 16 16 18 20

Asscending Order !

Preorder

A B C E I F J D G H K L

14 4 3 9 7 5 15 18 16 16 20

Postorder

I E J F C G K L H D B A

3 5 7 9 4 16 16 20 18 15 14

Binary SearchTree

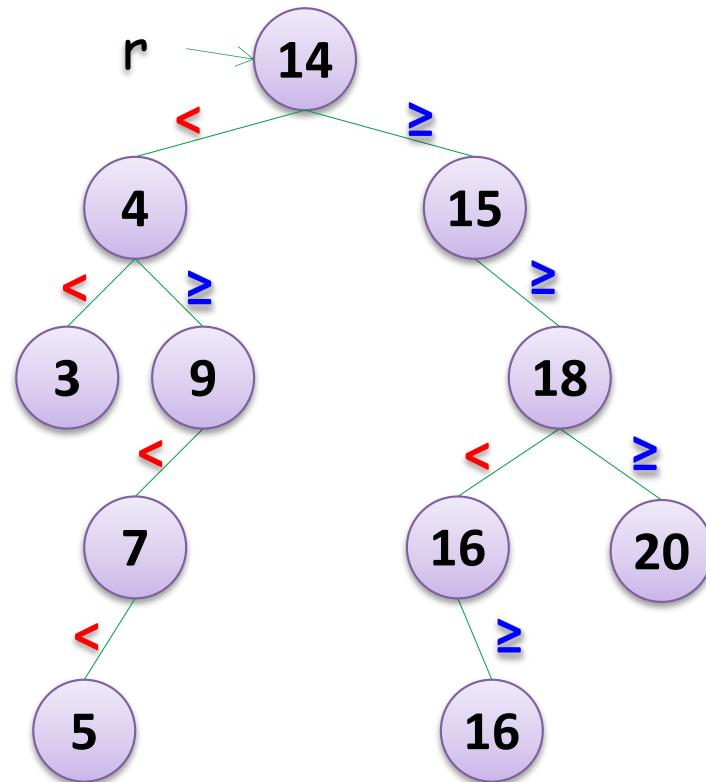

Binary Search Tree : for every node A

left decendents $< A$

right decendents $\geq A$

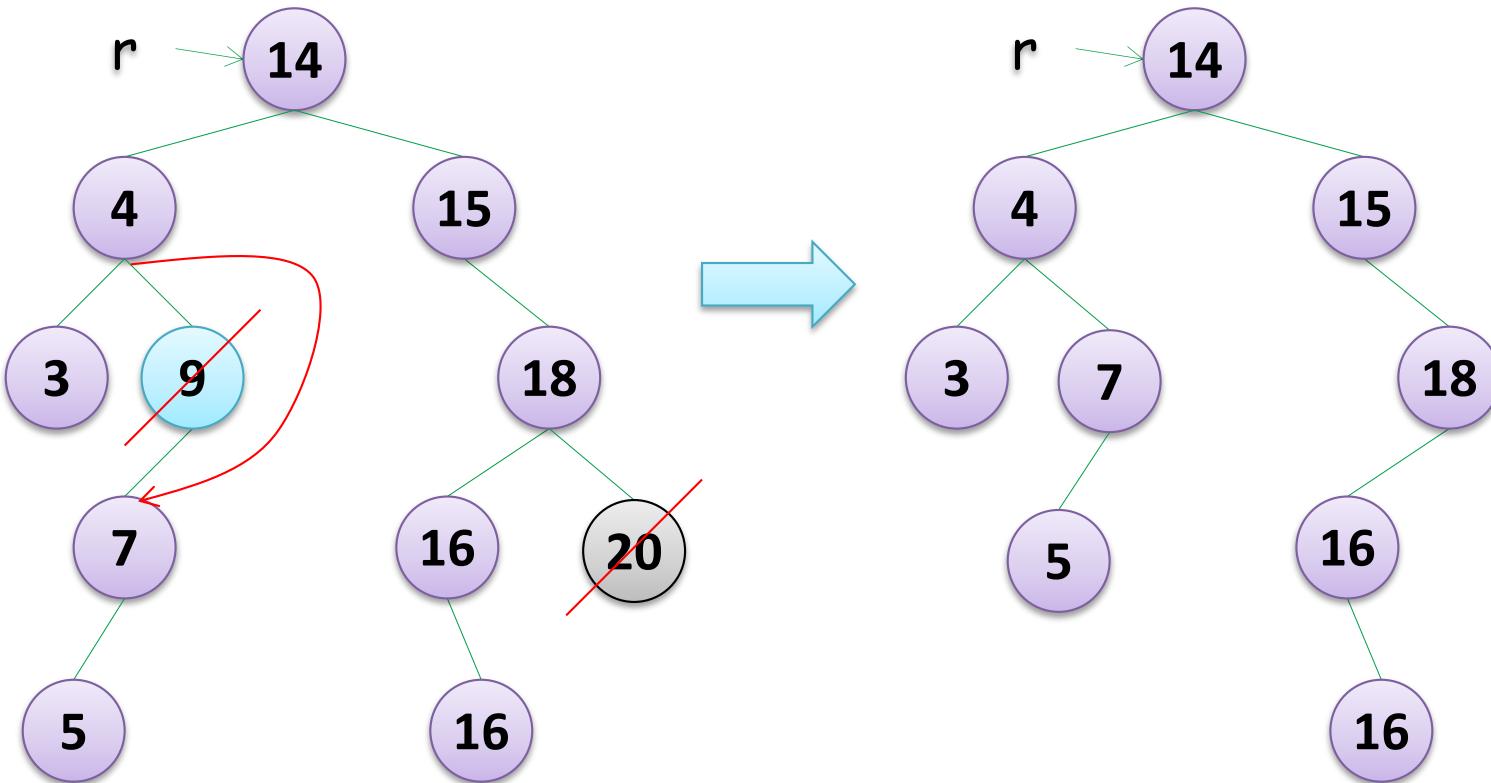

Insertion

Inserts : 14 4 9 7 15 3 18 16 20 5 16

Delete a : Leaf, Node with only 1 child

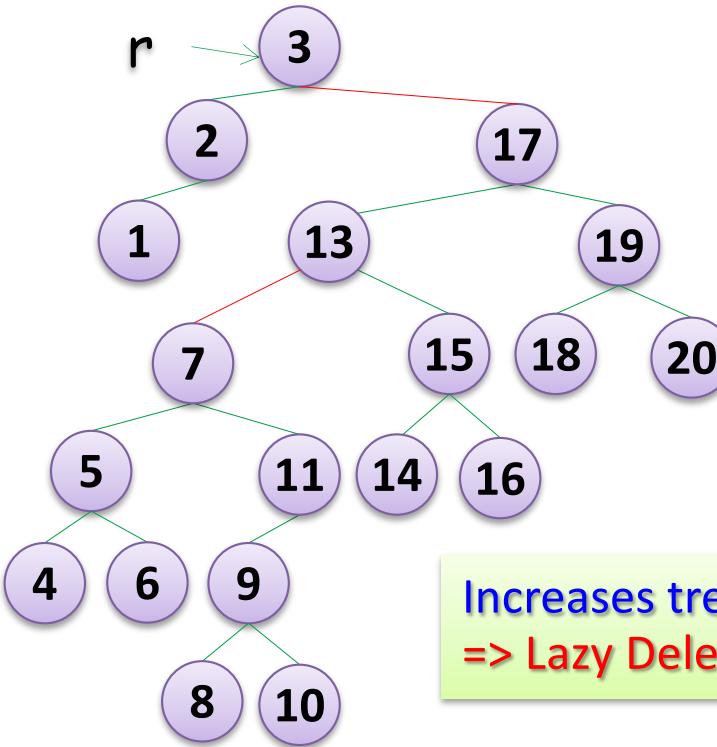

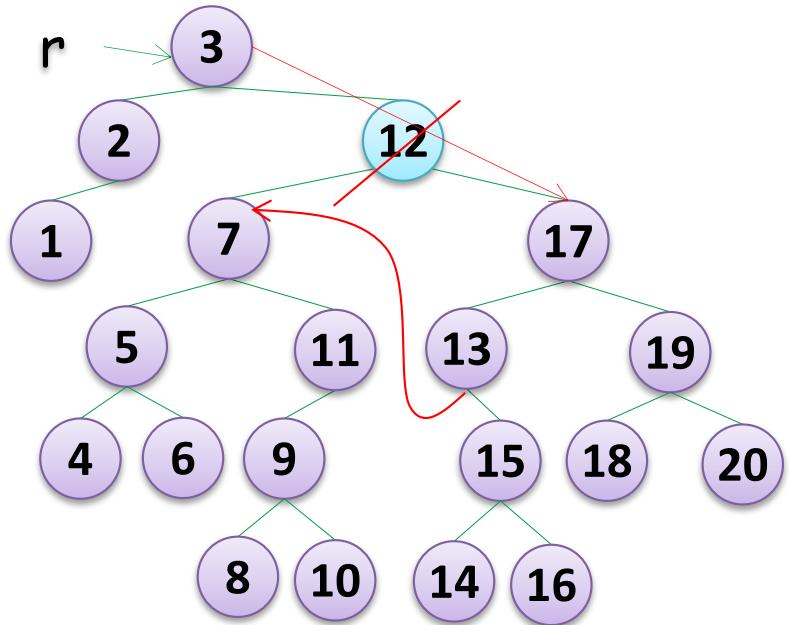

Delete Leaf

20 can be deleted right away, still be a binary search tree

Delete a node with only one child

Delete 9, replace a subtree at the deleted node

Delete a Node with Both Children : Lazy Deletion 1

Increases tree height.
=> Lazy Deletion

Delete 12

Where can we put tree 7, and tree 17 ?

Can replace only 1 at the deleted node.

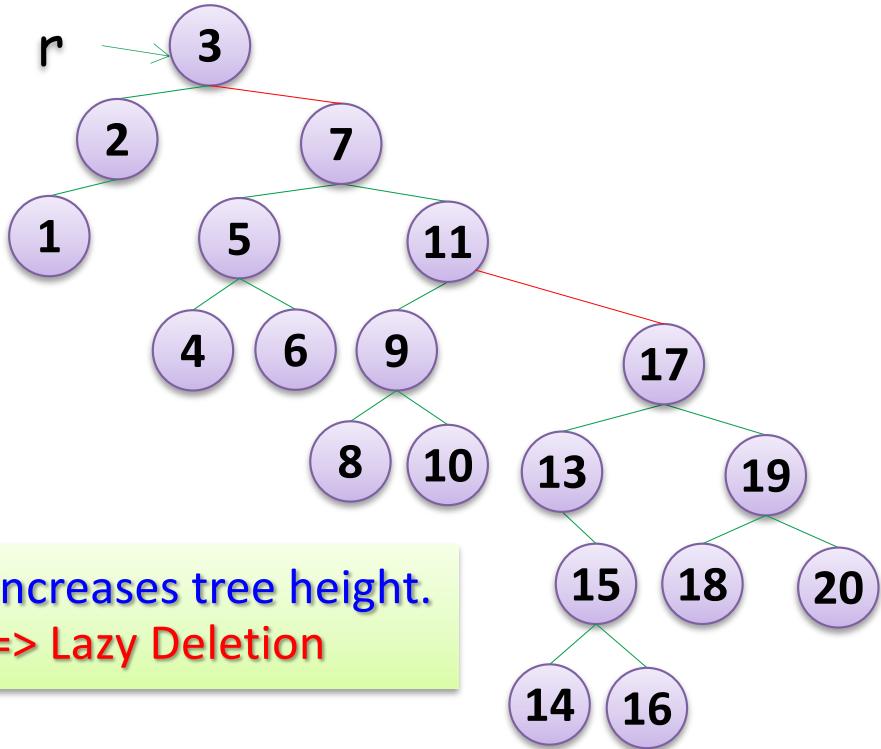

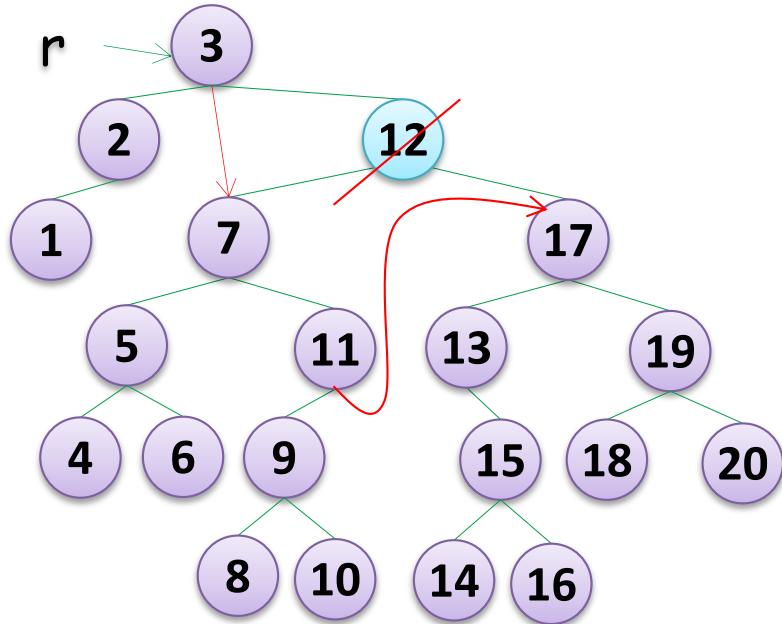

Let choose 17.

Where to put tree 7 ?

It's a binary search tree!

Where is its place ?

Delete a Node with Both Children : Lazy Deletion 2

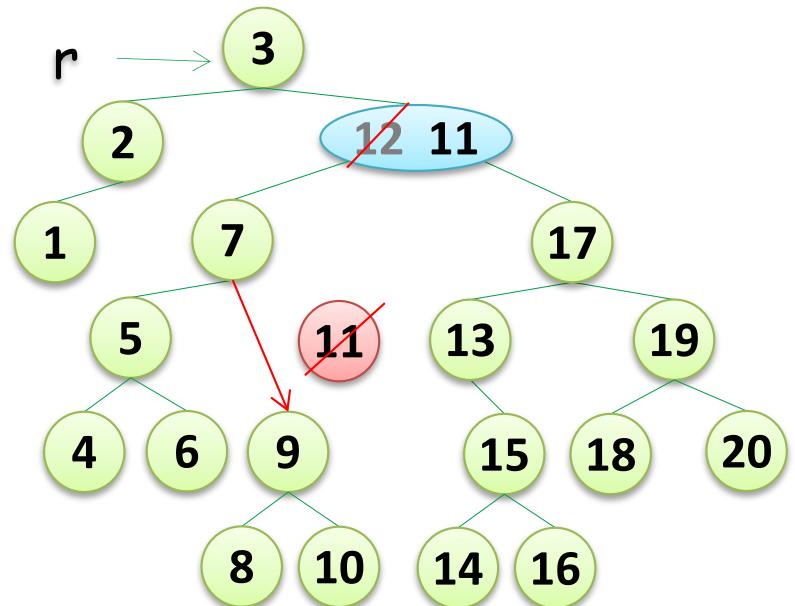

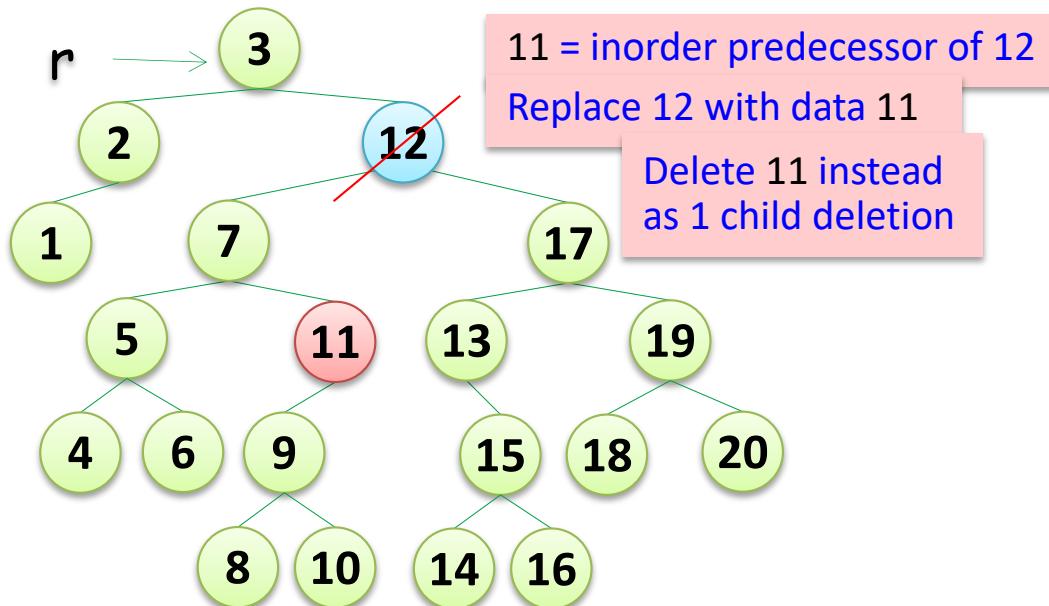

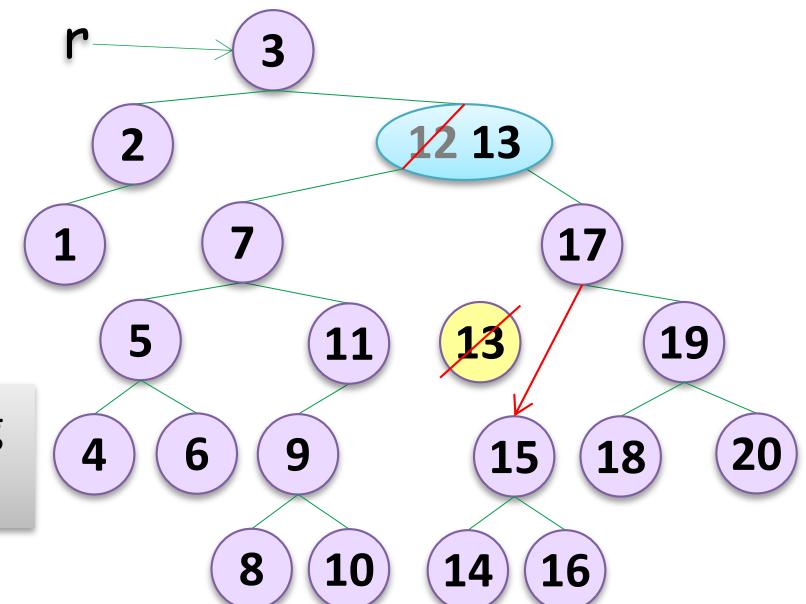

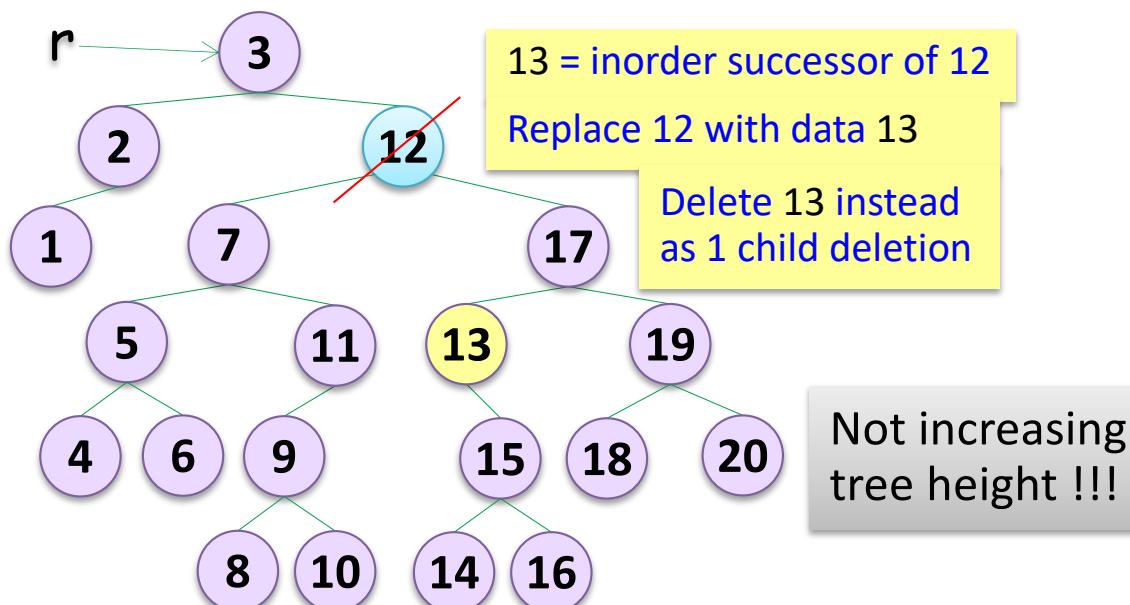

Delete 12

Can replace only 1 at the deleted node.

If we choose 7. Where is 17's place ?

Deletion : Using Inorder Successor / Predecessor

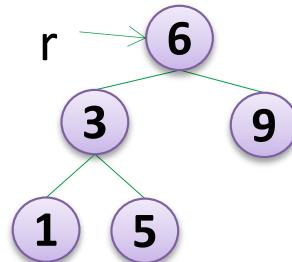

1. Tree Definitions

3. AVL Tree
4. Which Representations ?
5. n-ary Tree
6. Generic Tree
7. Multiway Search Tree
8. B-Trees

Binary Tree Representations

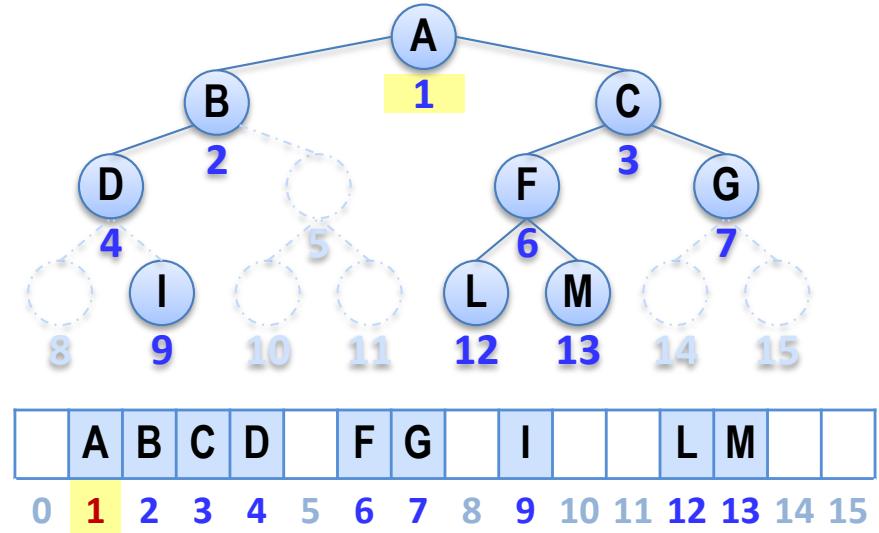

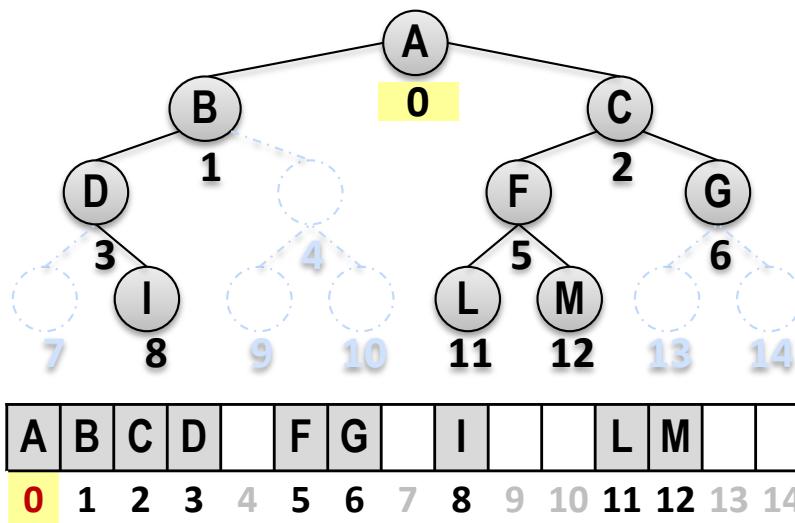

1. Dynamic

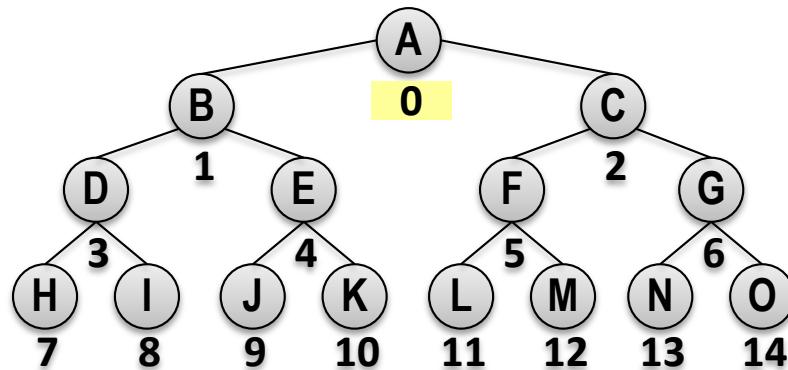

class node:

```
def __init__(self, data, left = None, right = None):  
    self.data = data  
    self.left = None if left is None else left  
    self.right = None if right is None else right
```

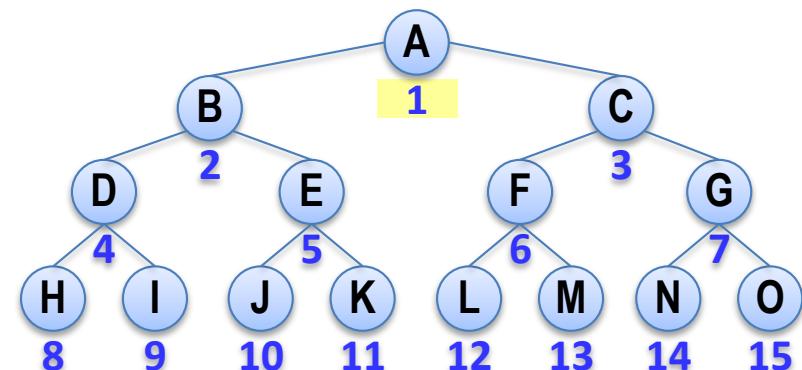

2. Sequential (Implicit) Array

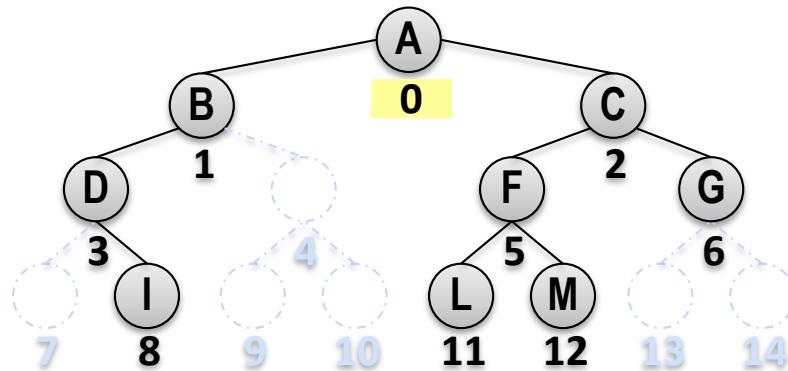

(Sequential) Implicit Array

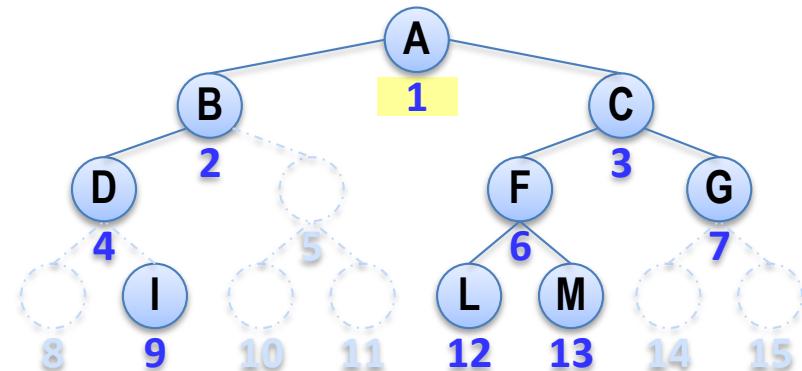

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

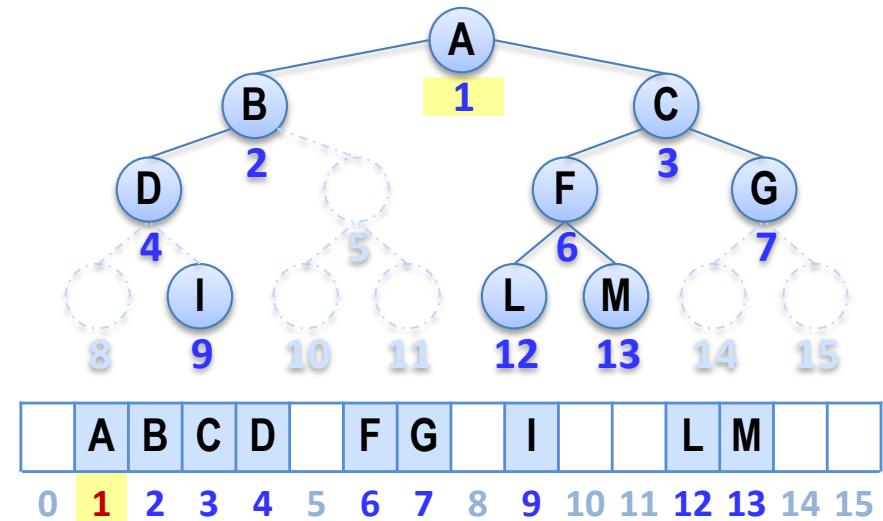

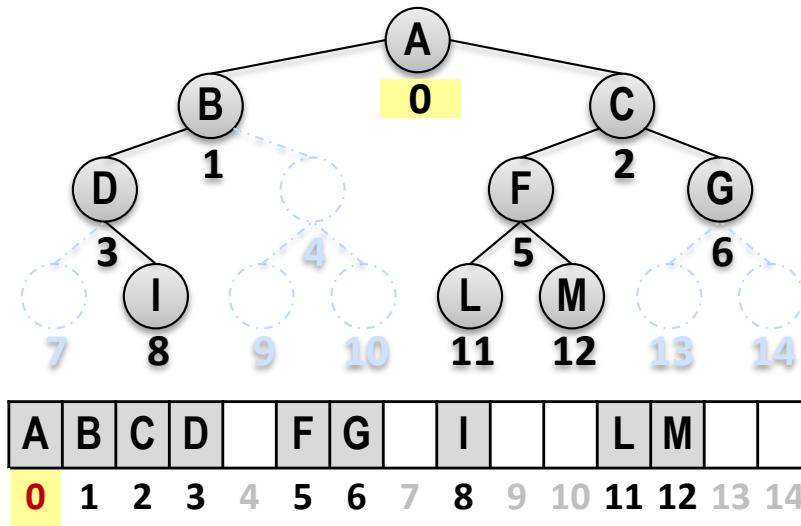

A	B	C	D		F	G		I		L	M			
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14

A	B	C	D		F	G		I		L	M			
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14

(Sequential) Implicit Array

Where is the **root** ?

The node at index i 's
left son ?
right son ?
father ?

Start at index 0

0
 $2i + 1$
 $2i + 2$
 $(i - 1) \text{ div } 2$

Start at index 1

1
 $2i$
 $2i + 1$
 $i \text{ div } 2$

So good ! No memory for link ! Easy to calculate !

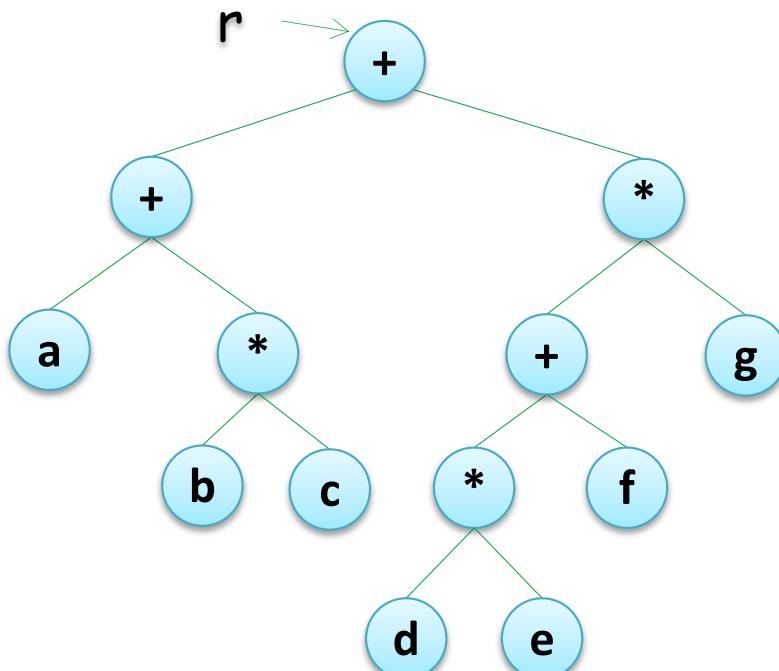

What happen if we have **only** node at indices : 0, 2, 6, 14 ? ie. **sparse**

What shape of tree should be best for sequential array?

8. B-Trees

Example : Expression Tree

$$(a + b * c) + ((d * e + f) * g)$$

Constructing an Expression Tree

input postfix form

`a b + c d e + * *`

Scan input from left to right.

Operand

Create an operand node and push to the stack

Operator

Create an operator node

Pop 2 operands to be its children.

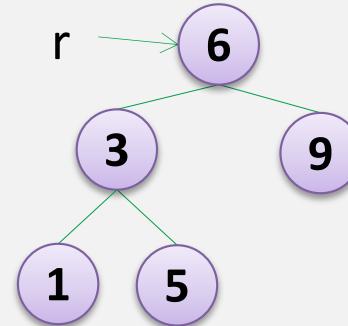

Push to the stack.

Node

```
class node:  
    def __init__(self, data, left = None, right = None):  
        self.data = data  
        self.left = None if left is None else left  
        self.right = None if right is None else right  
  
    def __str__(self):  
        return str(self.data)  
  
    def getData(self):          # accessor  
        return self.data  
  
    def getLeft(self):          # accessor  
        return self.left  
  
    def getRight(self):         # accessor  
        return self.right  
  
    def setData(self, data):    # mutator  
        self.data = data  
  
    def setLeft(self, left):    # mutator  
        self.left = left  
  
    def setRight(self, right):  # mutator  
        self.right = right
```

BST

```
class BST:  
    def __init__(self, root = None):  
        self.root = None if root is None else root  
  
    def addI(self, data):  
        if self.root is None:  
            self.root = node(data)  
        else:
